

WEB DESIGN DECAL

LECTURE 6

HTML5 and CSS3

Some more cool HTML and CSS features

HTML

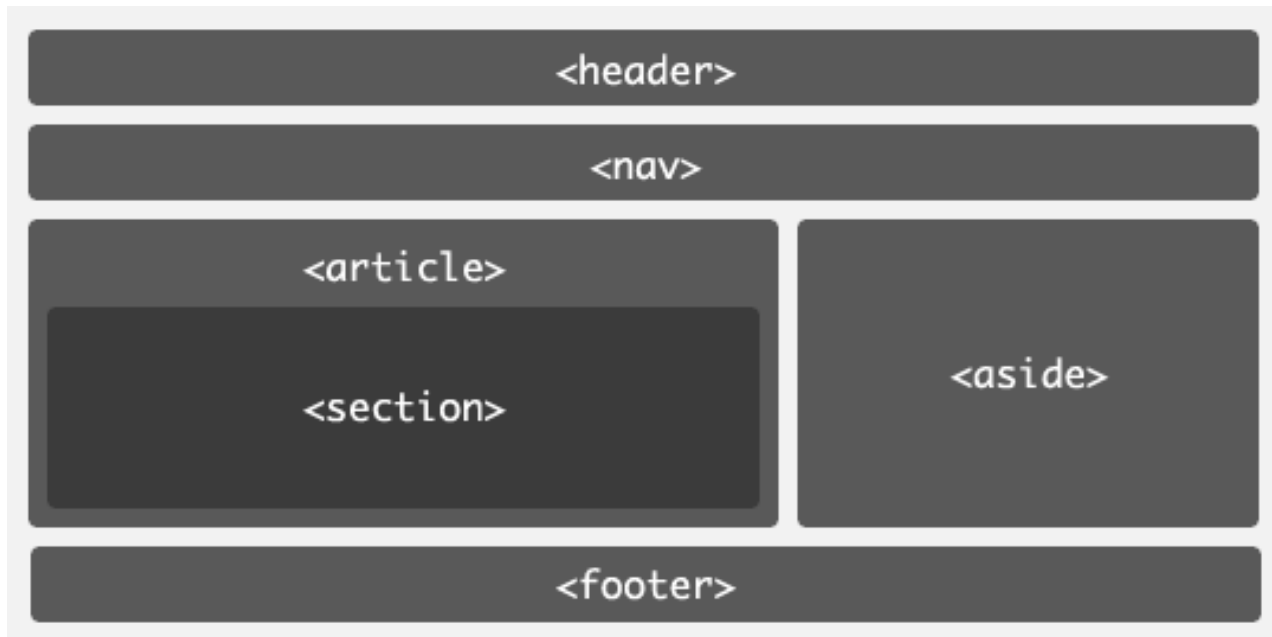

HTML5

New semantic tags: `<header>`, `<footer>`, etc.

Tags for multimedia: `<video>`, `<audio>`

Can now draw graphics in a `<canvas>`

HTML5

Compatible with CSS3

With a pinch of Javascript, can do things like:

Drag and drop

Geolocation!

HTML5 - <video>

To showcase non-web-hosted videos, here's a tag for that!

```
<video width="320" height="240" controls>  
  <source src="movie.mp4" type="video/mp4">  
  Your browser does not support the video tag.  
</video>
```

Note, within `<video>` is an error message for when HTML5 is unsupported!

Airbnb homepage is a great example.

HTML5 - <video>

```
<video width="320" height="240" controls>  
  <source src="movie.mp4" type="video/mp4">  
  Your browser does not support the video tag.  
</video>
```

Other attributes include:

controls (Shows pause, play, volume, etc.)

autoplay

loop

muted

FULL SCREEN VIDEO BACKGROUND DEMO

CSS

CSS3

With this version of CSS we get:

- Pseudo-classes

- Animations & 3D Transformations

- Transitions

PSEUDO-CLASSES

define special states for elements

PSEUDO-CLASSES

answer questions like:

“how do I make this change when I hover over it?”

CSS3 - :hover

Add effects based on the “action”

Examples

```
#navbar:hover {  
  background: teal;  
}
```

CSS3 - Pseudo-classes - :hover

CSS3 - Pseudo-classes

Common pseudo-classes:

`:hover` = When mouse “hovers” over element

`:visited` = Links you’ve visited

`:active` = Links when you click on them (fast)

`:focus` = When typing in the current `<input>` tag

Useful for making buttons.

CSS3 - Pseudo-classes - :active & :visited

:active (happens quickly)

[Click this Link](#)

[Click this Link](#)

:visited

[Click this Link](#)

CSS3 - Pseudo-classes - :focus

TRANSFORMS

answer questions like:

“how do I make this change when I hover over it?”

2D Transformations

Translate:

transform: translate(**x-val**, **y-val**);

Ex. **transform:** translate(**10px**, **20px**);

Rotate:

transform: rotate(**45deg**);

Scale:

transform: scale(**x-times**, **y-times**);

Ex. **transform:** scale(**2**, **1.5**);

Skew:

transform: skew(**x-deg**, **y-deg**);

Ex. **transform:** skew(**10-deg**, **40-deg**);

3D Transformations

Translate, rotate, scale ... but in 3D

Takes in 3 or 4 values now!

transform: translate3d(x, y, z);

transform: rotate3d(x, y, z, deg);

transform: scale3d(x, y, z);

TRANSITIONS

answer questions like:

“how do I make this change when I hover over it?”

CSS3 - Transitions

Move, scale, and change colors of elements (and more!)

Define the change from state A to state B

Syntax:

```
#box {  
  width: 50px;  
  height: 50px;  
  transition: 0.2s;  
}
```

```
#box:hover {  
  width: 100px;  
  height: 100px;  
}
```

TRANSITIONS DEMO

But sometimes, using just “transition”
isn't enough to be compatible!

Browser compatibility

CSS3 led to browsers rendering websites differently

Cross-Browser Compatibility - Developer's worst nightmare

The big 5:

Google Chrome

Mozilla Firefox

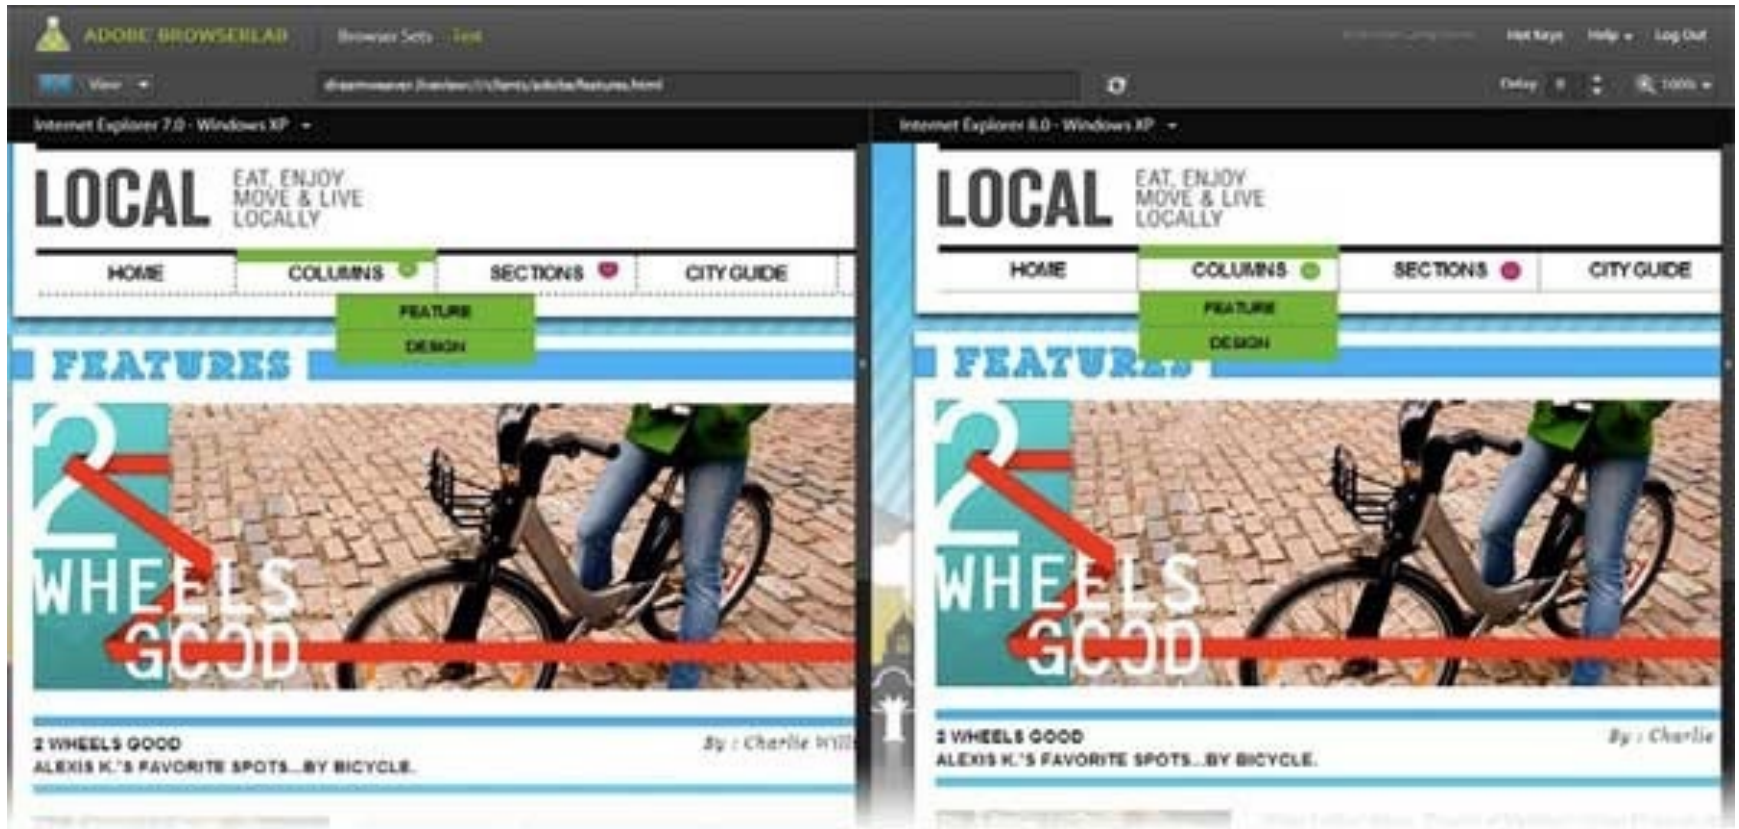

Safari by Apple

Opera

Internet Explorer (sadly)

Browser compatibility

Browser compatibility

Solution? **Vendor Prefixes.**

Add Vendor Prefixes in front of CSS3 styles (transitions, transforms, box-shadow, etc.)

Chrome and now Opera need -webkit-

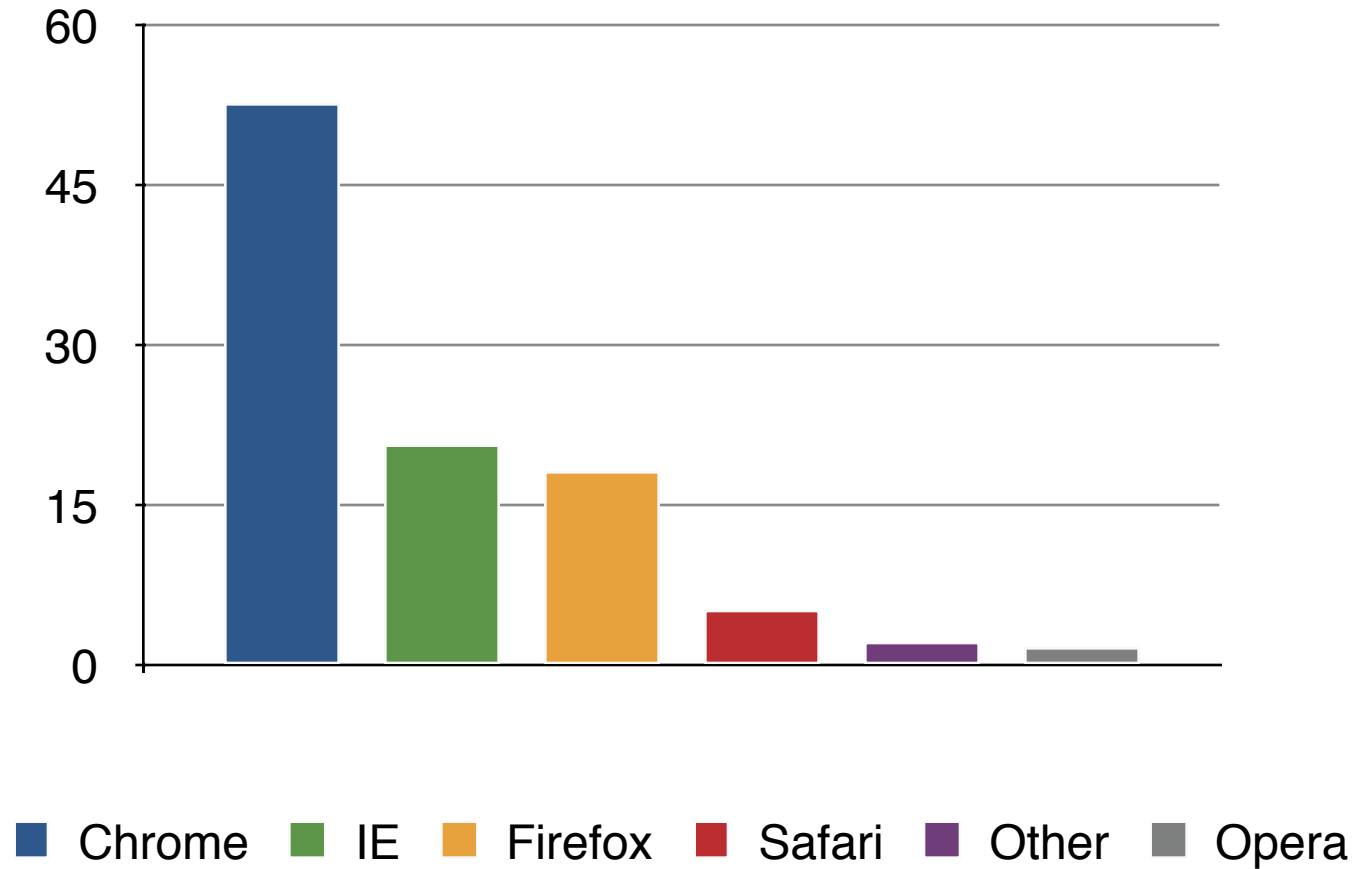

Ex. -webkit-transform

Firefox needs -moz-

Ex. -moz-transform

Browser compatibility
