

WEB DESIGN DECAL

LECTURE 11

Deploying to Github & Next Steps

Push your website online and further steps in web development

Today - Guest Lecture!

Taron Ghazaryan - Designer at Yelp

A heads-up for today:

1. Please download the Github for Mac/Windows application for today's hands-on! We'll need it for deploying a website to the web!

desktop.github.com

A heads-up for today:

2. Also, please create a Github Account (it's free!)

github.com

jQuery Cheat Sheet

Getting/Setting content

```
$( 'thing' ).text()  
$( 'thing' ).html()  
$( 'thing' ).val()
```

Event Listeners

```
$( 'thing' ).click()  
$( 'thing' ).hover()  
$( 'thing' ).scroll()
```

DOM Traversal

```
$( 'thing' ).parent()  
$( 'thing' ).children()  
$( 'thing' ).siblings()  
$( 'thing' ).find()
```

jQuery Effects

```
.show()  
.hide()  
.fadeIn(500)  
.fadeOut(500)
```

CSS Effects (Animations)

```
.css( 'attr', 'value' )  
.addClass( 'class' )  
.removeClass( 'class' )  
.hasClass( 'class' )
```

What are we doing today?

- Our favorite jQuery plugins
- How to deploy websites to the World Wide Web
- Life after WDD

Let's talk
jQuery Plugins

jQuery Plugins

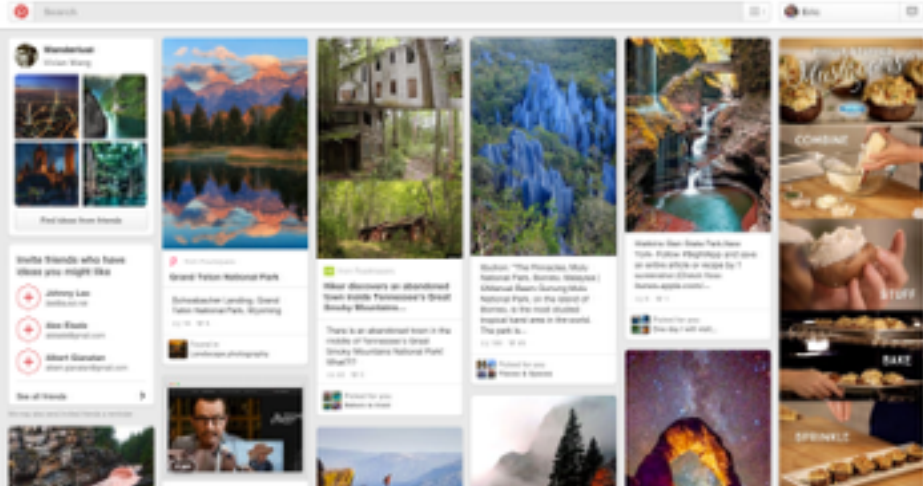

Some developers take really common UI elements and open source them as plugins

Examples: Photo Slider, Pre-made Menus, Tile views, etc.

Our favorite plugins

1. jQuery Masonry (for that Pinterest UI)
2. Waypoints.js (Infinite Scroll and others)
3. Unslider (Mobile responsive photo sliders)

Masonry

Waypoints.js

<http://imakewebthings.com/jquery-waypoints>

Easy “Sticky” Navigation bars

Scroll Analytics

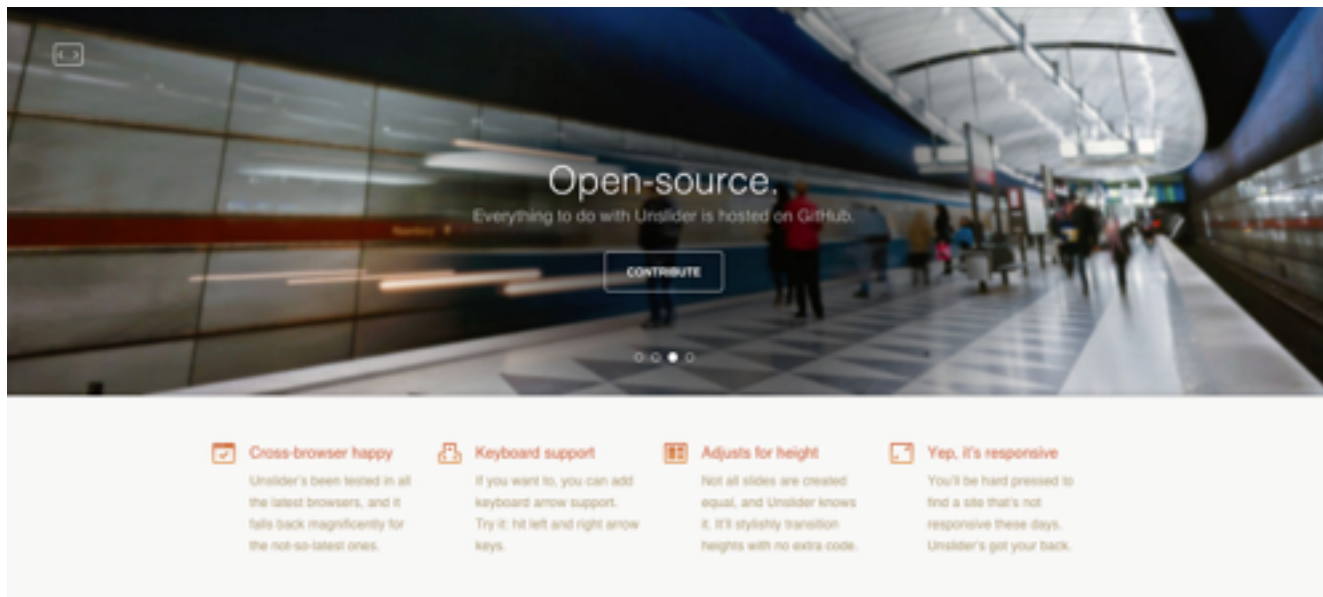

Infinite Scroll

Unslider.js

unslider.com/

Responsive photo sliders

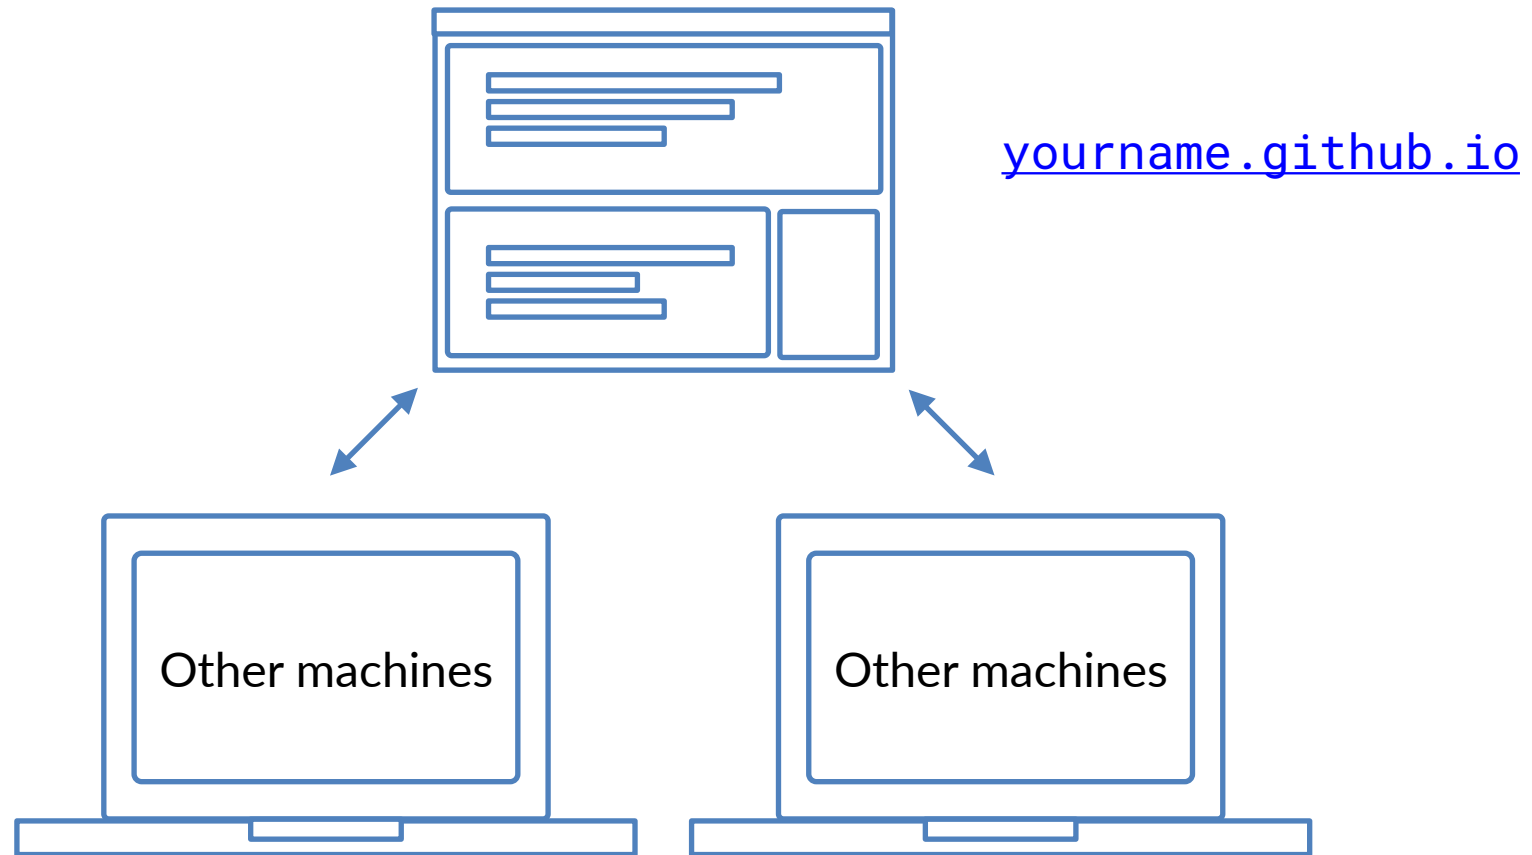

What does it mean to “deploy”?

Your website — currently

`file:///Users/you/WDD/yoursite/index.html`

Your website – soon to be

What is Github?

An analogy — engineering

Github

The Web-based Version Control
application

A host for your static pages!

Companies & Projects Using Git

Google

facebook

Microsoft

twitter

LinkedIn

NETFLIX

Github

It's often the modern resume for the software developer
Usually done with a series of commands on your Terminal
This logo is of its mascot, the Octocat

Getting a custom domain name

I recommend reserving on www.namecheap.com
Easily configurable with Github Pages

 Dashboard Expiring Soon Domain List Product List Profile

Domains → Details

 Domain Products Sharing & Transfer Advanced DNS

HOST RECORDS

 Actions ▾ Filters ▾

Search

<input type="checkbox"/> Type	Host	Value	TTL	
<input type="checkbox"/> A Record	@	192.30.252.153	30 min	
<input type="checkbox"/> A Record	@	192.30.252.154	30 min	
<input type="checkbox"/> CNAME Record	www	eric-ls.github.io.	30 min	

So what's next after WDD?

Parting thoughts

Other Libraries and Frameworks to check out:

Angular JS (by Google)

React JS (by Facebook) 

D3.js (Interactive data visualizations)

Node.js (For doing the backend)

SASS (A more powerful CSS) 

CoffeeScript (JS with different syntax)

Parting thoughts

The Back-End

Learn back-end frameworks like Django, Ruby on Rails, PHP

Django uses Python

Typically takes longer than front-end to learn

Consider CS169 (Typically uses Ruby on Rails)

Databases

Back-End languages communicate with the database

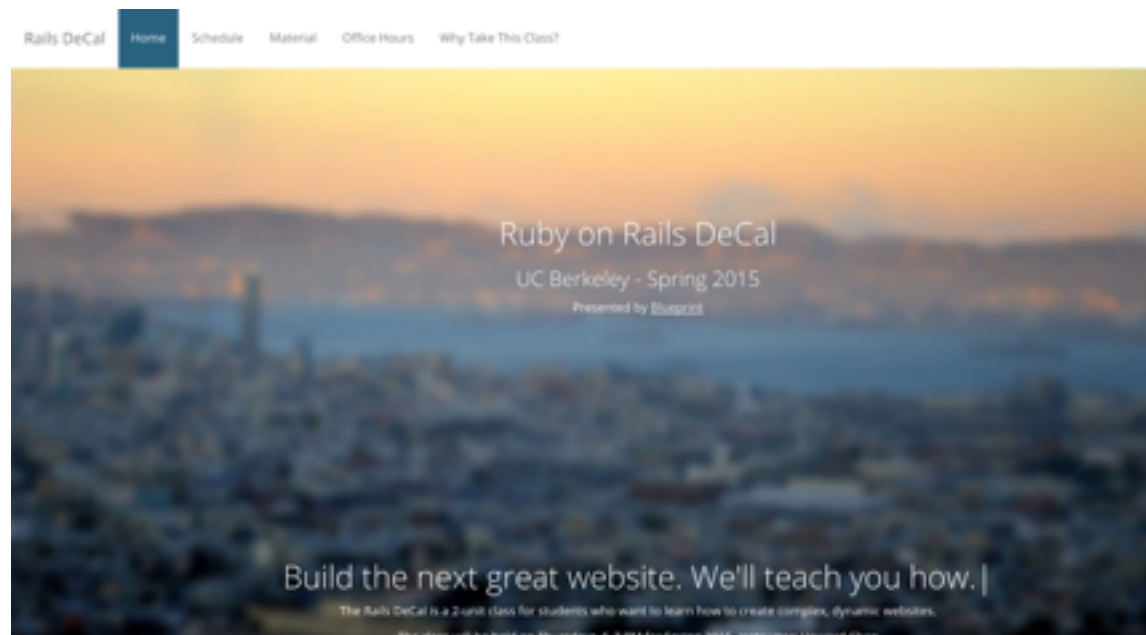

Store user data, website data, etc.

MySQL, MongoDB (NoSQL), PostgreSQL, SQLite3

Parting thoughts

The Back-End

Shouts out to the Ruby on Rails DeCal! (www.railsdecal.com)

Parting thoughts

Congrats, you're an entry-level front-end developer :)

Can say you have HTML5/CSS3/JavaScript on resumé

Try freelance dev, contributing to OSS, or interning

Parting thoughts

Companies and their web “stacks”:

All use JavaScript

Facebook — PHP & Python

Google — Python (Django)

Apple — Everything, essentially

LinkedIn — Node.js

Yahoo — PHP

Twitch.tv — Ruby on Rails

Thanks so much everyone :')

Hamza - Setting up Git
